Elsewhere in the theoretical writings the word "fabric" has several other meanings which are more limited than meanings of the UF-theory of this report. The word "fabric" has still been considered to be the best available word for this UF-theory. The word "fabric" in this theory is closer to word "fabrik" in German languages, meaning a factory, not only the building but also the whole comprehensive system, including the activities.

The words Walking City, Transit City, Car City have been used also for classification of the historical development phases of the cities and for classification of cities in global comparisons (e.g. Newman-Kenworthy).

**Elements of the Fabrics**

Each fabric consists of elements, which are areas or units of the built environment including buildings and other structures of blocks, courtyards, streets and other open spaces. The elements can be also systems and networks of infrastructure, services and traffic.

**Zones of the Urban Fabrics**

The fabrics can be clearly distinguished, but they are not all separate from each other and from many parts they are overlapping and mixing with each other. The fabrics can still be recognised and handled also as zones and sub-zones or sub-areas, depending on the scale and purpose of the analysis or the plan.
